#### 1 INTRODUCTION

UC paper [Canetti 2001]. TODO: Lots!

#### 2 OVERVIEW

#### 3 ILC

 Definition 3.1 (Protocol Emulation). Let  $\pi$  and  $\phi$  be probabilistic polynomial time (p.p.t) protocols. We say that  $\pi$  UC-emulates  $\phi$  if for any p.p.t. adversary  $\mathcal A$  there exists a p.p.t. ideal-process adversary  $\mathcal S$  such that for any balanced PPT environment  $\mathcal Z$  we have:

$$\text{Exec}_{\phi, S, Z} \approx \text{Exec}_{\pi, \mathcal{A}, Z}$$
.

Definition 3.2 (Code-Based Protocol Emulation). Let  $\mathcal{L}_{\pi}$  and  $\mathcal{L}_{\phi}$  be p.p.t. program terms. We say that  $\mathcal{L}_{\pi}$  UC-emulates  $\mathcal{L}_{\phi}$  if for any p.p.t. adversary term  $\mathcal{L}_{\mathcal{A}}$  there exists a p.p.t. ideal-process term  $\mathcal{L}_{\mathcal{S}}$  such that for any balanced p.p.t. environment term  $\mathcal{L}_{\mathcal{Z}}$  we have:

$$\text{EVAL}_{\mathcal{L}_{\phi}}, \mathcal{L}_{\mathcal{S}}, \mathcal{L}_{\mathcal{Z}} \approx_{\epsilon} \text{EVAL}_{\mathcal{L}_{\pi}}, \mathcal{L}_{\mathcal{A}}, \mathcal{L}_{\mathcal{Z}}.$$

How to define  $\approx_{\epsilon}$  relation? Observational equivalence is a stronger notion than computational equivalence [Comon-Lundh and Cortier 2008]. However, they also show that indistinguishability (based on games) is soundly abstracted by trace equivalence.

### 4 METATHEORY

# **5 IMPLEMENTATION**

- (1) Bidirectional type checker
- (2) Replication

## **6 EXPERIMENTS**

Impossibility of UC commitments using standard assumptions [Canetti and Fischlin 2001].

# **Functionality** $\mathcal{F}_{COM}$

 $\mathcal{F}_{COM}$  proceeds as follows, running with parties  $P_1, \ldots, P_n$  and an adversary S.

- (1) Upon receiving a value (Commit, sid,  $P_i$ ,  $P_j$ , b) from  $P_i$ , where  $b \in \{0, 1\}$ , record the value b and send the message (Receipt, sid,  $P_i$ ,  $P_j$ ) to  $P_j$  and S. Ignore any subsequent Commit messages.
- (2) Upon receiving a value (Open, sid,  $P_i$ ,  $P_j$ ) from  $P_i$ , proceed as follows: If some value b was previously recorded, then send the message (Open, sid,  $P_i$ ,  $P_j$ , b) to  $P_j$  and S and halt. Otherwise halt.

1:2 Anon.

```
let F_com = lam S .

let ('Commit, sid, P_i, P_j, b) = rd ?p2f in req mem b \{0,1\} in

wr (('Receipt, sid, P_i, P_j), \{P_j, S\}) \rightarrow ?f2p;

let ('Open, sid, P_i, P_j) = rd ?p2f in

wr (('Open, sid, P_i, P_j, b), \{P_j, S\}) \rightarrow ?f2p in

nu f2p, p2f .

| \triangleright (F_com S)
```

### A APPENDIX

Short Title 1:3

Val	ue Types	A, B ::= x	Value variable
		unit	Unit value
		nat	Natural number
		$\mid A \times B$	Product
		A+B	Sum type
		<b>!</b> A	Intuitionistic type
		<b>Rd</b> <i>A</i>	Read channel
		<b>W</b> r <i>A</i>	Write channel
		<b>U</b> <i>C</i>	Thunk type
Cor	nputation Types	$C, D := A \rightarrow C$	Value-consuming computation
	71	<b>F</b> A	Value-producing computation
Lin	ear Typing Contexts	$\Delta ::= \cdot \mid \Delta, x : A$	
Intı	uitionisitic Typing Contexts	$\Gamma ::= \cdot \mid \Gamma, x : A$	

Fig. 1. Syntax of types and typing contexts

Values	v := x	
	l ()	Unit value
	<i>n</i>	Natural number
	$\mid (v_1, v_2)$	Pair of values
	$ \inf_{i}(v) $	Injected value
	chan(c)	Channel (either read or write end)
	$  \operatorname{thunk}(e)  $	Thunk (suspended, closed expression)
Expressions	$e ::= \operatorname{split}(v, x_1.x_2.e)$	Pair elimination
	$  case(v, x_1.e_1, x_2.e_2)$	Injection elimination
	$  \operatorname{ret}(v)  $	Value-producing computation
	$  \operatorname{let}(e_1, x.e_2)$	Let-binding/sequencing
	e v	Function application
	$ \lambda x.e $	Function abstraction
	force(v)	Unsuspend (force) a thunk
	$  \operatorname{wr}(v_1 \leftarrow v_2)  $	Write channel $v_1$ with value $v_2$
	$ \operatorname{rd}(v) $	Read channel $v$
	vx. e	Allocate channel as $x$ in $e$
	$\mid e_1 \mid \triangleright e_2$	Fork $e_1$ , continue as $e_2$
	$\mid e_1 \oplus e_2$	External choice between $e_1$ and $e_2$

Fig. 2. Syntax of values and expressions

Modes  $m, n, p := W \mid R \mid V$  (Write, Read and Value)

 $m \parallel n \Rightarrow p$  The parallel composition of modes m and n is mode p.

$$\frac{m \parallel n \Rightarrow p}{n \parallel m \Rightarrow p} \text{ sym} \qquad \frac{}{W \parallel V \Rightarrow W} \text{ wv} \qquad \frac{}{W \parallel R \Rightarrow W} \text{ wr} \qquad \frac{}{R \parallel R \Rightarrow R} \text{ rr}$$

 $m : n \Rightarrow p$  The sequential composition of modes m and n is mode p.

$$\frac{1}{\mathsf{V}\,;\,n\Rightarrow n}\,\,^{\mathsf{v}*}\qquad \qquad \frac{1}{\mathsf{W}\,;\,\mathsf{V}\Rightarrow\mathsf{W}}\,\,^{\mathsf{WV}}\qquad \qquad \frac{1}{\mathsf{R}\,;\,n\Rightarrow \mathsf{R}}\,\,^{\mathsf{r}*}\qquad \qquad \frac{1}{\mathsf{W}\,;\,\mathsf{R}\Rightarrow\mathsf{W}}\,\,^{\mathsf{WI}}$$

Note that in particular, the following mode compositions are not derivable:

- W | W  $\Rightarrow$  p is not derivable for any mode p
- W; W  $\Rightarrow$  p is not derivable for any mode p

Fig. 3. Syntax of modes; sequential and parallel mode composition.

 $\Delta$ ;  $\Gamma \vdash e : C \rhd m$  Under  $\Delta$  and  $\Gamma$ , expression e has type C and mode m.

$$\frac{\Delta; \Gamma \vdash v : A}{\Delta; \Gamma \vdash ret(v) : FA \rhd V} \text{ ret} \qquad \frac{\Delta_1; \Gamma \vdash e_1 : FA \rhd m_1}{\Delta_2, x : A; \Gamma \vdash e_2 : C \rhd m_2} \text{ let} \\
\frac{\vdots \Gamma \vdash v : A}{\Delta; \Gamma \vdash ret(v) : F(!A) \rhd V} \text{ ret!} \qquad \frac{\Delta_1; \Gamma \vdash v : !A \qquad \Delta_2; \Gamma, x : A \vdash let(e_1, x.e_2) : C \rhd m}{\Delta_1, \Delta_2; \Gamma, x : A \vdash let!(v, x.e) : C \rhd m} \text{ let!} \\
